

Ventilation/Perfusion Quant NM

Ventilation/Perfusion Quant NM:

Technique: A ventilation-perfusion scan was performed with 8 projections. 45 mci TC 99M DTPA was administered for ventilation scan. 5 mci Technetium 99MAA administered for perfusion scan.

Findings:

The ventilation perfusion exam demonstrates normal aeration of the lungs with no ventilation defects.

Perfusion exam demonstrates normal perfusion with no perfusion defects. There is no ventilation-perfusion mismatch.

IMPRESSION:

1. Normal ventilation perfusion exam.
2. No evidence of pulmonary emboli.
